REBY29

Tibosomal protein L27a.e, cytosolic - yeast (Saccharomyces cerevisiae)

NiAlternate names: protein G3101, protein YGL103w; ribosomal protein YL29

C;Species: Saccharomyces cerevisiae

C;Date: 25-Feb-1985 #sequence_revisiae

C;Accession: A07782; S4569; S64110

R;Kacufer, N.F.; Fried, H.M.; Schwindinger, W.F.; Jasin, M.; Warner, J.R.

A;Title: Cycloheximide resistance in yeast: the gene and its protein.

A;Accession: A02782

A;Molecule Lype: DNA

A;Residues: 1-149 KAU-

A;Title: Transcriptional elements of the yeast ribosomal protein gene CYH2.

A;Title: Transcriptional elements of the yeast ribosomal protein gene CYH2.

A;Title: Transcriptional elements of the yeast ribosomal protein gene CYH2.

A;Title: Transcriptional elements of the yeast ribosomal protein gene CYH2.

A;Title: Transcriptional elements of the yeast ribosomal brotein gene CYH2.

A;Title: Transcriptional elements of the yeast ribosomal some subsiders: 1-16 kGCM.

A;Reference number: S45696

A;Molecule Lype: DNA

A;Reference number: S45696

A;Molecule Type: DNA

A;Reference number: S64101

A;Molecule type: DNA

A;Reference number: S64101

A;Molecule type: DNA

Included Acids Res. 284.317-4331 (2000).

Included Selection Condensation reaction between C acroms 2 and 3 of pyruvate and glyceraldebyde 3-phosphate to yield 1-deoxy-D-xylulose-5-phosphate (DXP) (By similarity).

Included AcTIVITY: Pyruvate + D-glyceraldebyde 3-phosphate = 1-deoxy-D-xylulose 5-phosphate + CO(2).

COFACTOR: Thiamine pyrophosphate (By similarity).

Included Selection Cofficient C
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SUBŪNIT: Homodimer (By similarity).

"Modulation of Rap activity by direct interaction of Galphao with Rapl
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         GTPase-activating protein.";
J. Biol. Chem. 274:21507-21510 (1999).

-I- FUNCTION: INHIBITS SIGNAL TRANSDUCTION BY INCREASING THE GTPASE
ACTIVITY OF G PROTEIN ALPHA SUBUNITS THEREBY DRIVING THEM INTO
THEIR INACTIVE GDP-BOUND FORM.
-I- SUBCELLULAR LOCATION: Membrane-bound (Potential).
-I- PTM: FATTY ACYLATED. HEAVILY PALMITOYLATED IN THE CYSTEINE STRING
MOTIF (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,
